DMS · PERFORMANCE MANAGEMENT

ERM 2.0

How a business-built tool became a stable, industrial app, rebuilt by 2 developers in one PI with AI-assisted migration

[Team name] · [Presenter names] · [Date]

Product Streams Scope

Company performance management

Enable our business to monitor the company and organisations' TBO, TCO and TFO, and risk management

- A Perfo
- BL Perfo
- Portfolio Analyser
- D Perfo
- HR Perfo
- B Perfo
- BS Perfo
- O Perfo
- Q Perfo
- KPI Tree
- KPI Store
- ERM
- IE MBR

Sustainability & Performance

Substances Data

Regulated chemical substances: traceability, compliance and declaration

- Halon Stock Management
- Banned Substances
- HazMat DP
- Batteries & Conformity Reporting
- HazMat Core Operational Reporting

Environmental monitoring & reporting

Energy and water consumption; waste, CO2 and VOC emissions for HM and O perimeters

- eIODA
- High5+ Cockpit
- eCockpit

New Energies Market

Analytics on SAF and liquid hydrogen over conventional fuel, for a reduced carbon footprint

- SAFIR
- Hymenu

Other Airbus tools: run mode

- App Portal
- Skywise Home Page
- Arcane

ERM

Enterprise Risk Management

Enterprise Risk Management (ERM)

ERM definition: the risk management process is an integral part of management and decision-making, helping stakeholders understand risks and the actions required.

Application context: streamlines ERM reporting using Active Risk Manager (ARM) data ingested into Palantir Skywise.

Single place for ARM data
Centralised management and live view of ARM risks

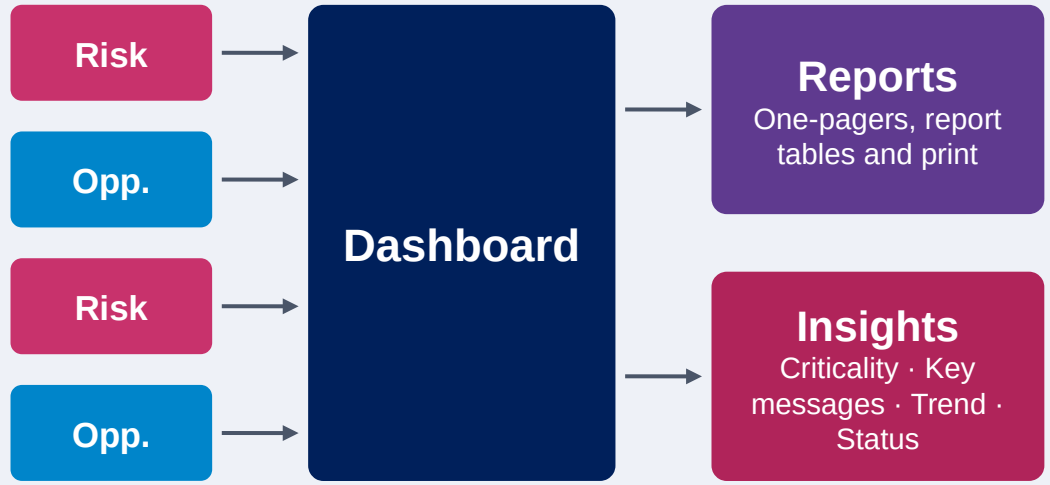

Custom dashboards
Group risks and opportunities into dedicated dashboards

Live editing and trend following
Edit parameters live and track trends

Structured release workflow
Formal, governed quarterly review and release

Cross-team collaboration
Share and co-manage dashboards across divisions

ARM DATA INTEGRATION & REPORTING FLOW

From business tool to industrial product

Built by Operations
Started as a Business Owned Tool (BOT) in Slate

→

Adopted by other functions
It grew fast, because people needed it

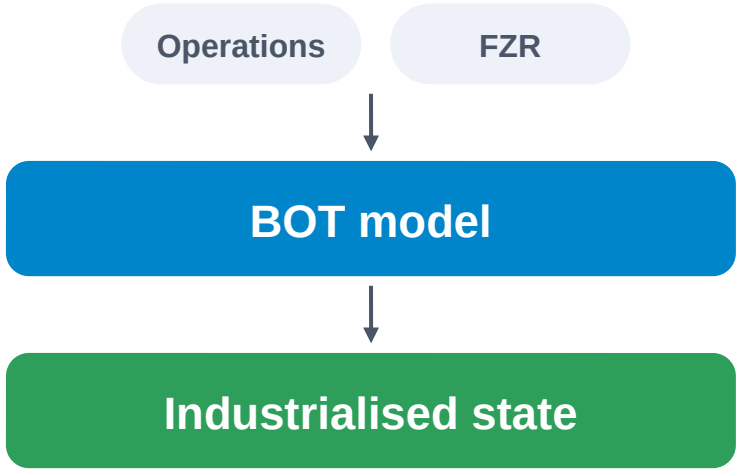

→

Owned by FZR
FZR is the business owner today

→

Industrialised and migrated
We made it robust, then rebuilt it as ERM 2.0

THE MODEL SHIFT

TRANSITION ROADMAP

2024
BOT industrialisation
We took it over, standardised and enhanced it

2025
Scale & shift
More users and functions; Slate reaches its limits

2026
Run phase
ERM 2.0 rebuilt in React, ready for go-live

BOT: Business Owned Tool

ERM is business-critical for 892 users

One place to manage risks and opportunities: dashboards, live editing, trends, releases and sharing

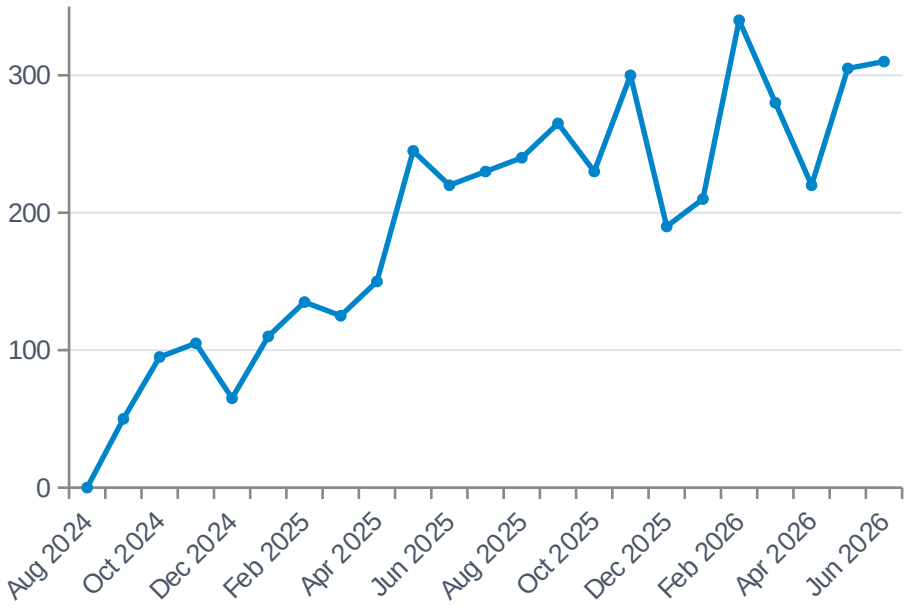

892
lifetime unique users

320+
active in a peak month

1,600+
dashboards created

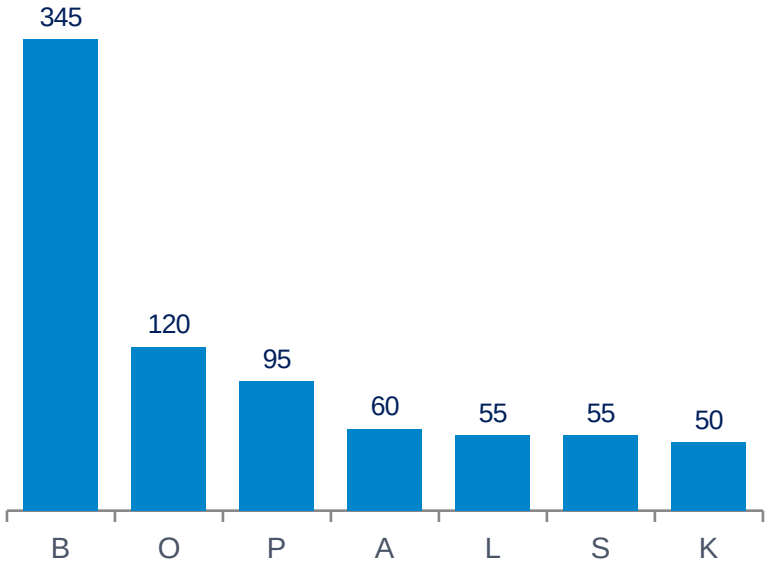

10+
updated every day

MONTHLY UNIQUE USERS

Approximate, read from the ERM usage chart

USERS BY FUNCTION (SIGLUM 1)

Plus about 12 smaller functions. Approximate

From a fragile app to a stable ERM 2.0, in one PI

BEFORE · SLATE

One change could break another

Slow to switch between tabs

Nothing documented

AI-assisted migration

The AI does the heavy lifting, people verify every feature

AFTER · ERM 2.0

Stable: each feature stands alone

Faster and smoother

Documented, easy to extend

Same features, more stable, in one PI

1 PI
2 developers, whole migration

105
features carried over and checked

11
new features, like custom one-pager layouts and slideshow

Faster
navigation between tabs

7
security issues found and fixed

0 → 10
documents for future owners

BEFORE: SLATE

- Every change was risky and slow
- One fix could break another dashboard
- Knowledge lived in a few heads

AFTER: ERM 2.0

- Each feature stands alone: changes are quick and safe
- Faster, smoother navigation
- Documented, on a standard stack any team can pick up

~76%

less effort than a manual migration

≈ $80K saved on the build
≈ $10K a year less maintenance

Estimates at $38.50 per developer hour: 4 sprints (≈ $25K) actual against ~17 sprints (≈ $105K) for a manual migration. Maintenance: ~20% of build effort a year (≈ $21K), assumed halved by modular, documented code.

What the business says

Feedback from ERM business stakeholders, September 2026

> *Thanks to a mix of regular teamwork with the business and strong IT skills, they have turned an idea into a user-friendly industrial [solution]… User interface and performance have significantly improved.*

ERM Centre of Competence
[Name]

> *The Skywise ERM dashboard application is a tremendous addition to our ERM toolset… More and more users regularly prepare and facilitate risks & opportunities reviews with the application.*

ERM Stakeholder
[Name]

> *They built great new features that make navigation easier and give us a much clearer view of our R&O data. Whenever bugs or issues came up, they fixed them quickly and efficiently.*

Risk and Opportunity Manager
[Name]

Four 2026 objectives, one team effort

OUR PROJECT	EVIDENCE	2026 OBJECTIVE
ERM 2.0 AI-assisted migration Slate to React 2 developers · 1 PI	AI-assisted migration recovered all 105 features of an undocumented app	**Leverage AI to solve business problems** India TFO · Digital: democratise AI
	Delivered in 1 PI by 2 developers, about 76% less effort than a manual estimate	**Deliver on time, on cost, on quality** Digital: optimise our digital resources
	A business-critical tool, now stable, documented and ready to leave Slate	**Ensure our operational performance** Digital: availability of systems for operations
	A reusable playbook lets other teams do the same	**Grow digital acumen and competencies** Digital: develop our people · India TFO

BUILT TOGETHER Operations built it · FZR owns it · Business users confirmed every feature · Data and security owners kept restricted views intact

A playbook any team can run next

Gather → **Catalogue** → **Compare** → **Fix** → **Document**

Ready to reuse

- A script that gives the AI the whole app at once
- Feature comparison template
- Architecture and lifecycle diagram formats

Where next

- ERM 2.0 go-live and run phase with FZR
- Other Slate apps in [business areas]
- Functions beyond DMS, via the architecture sync
- Any low-code tool with little documentation

Our ask

Support the playbook as a standard way to move business-built tools to industrial apps. We have aligned with [Architect] to propose it at the architecture sync.

[Next: a first team outside DMS]

From a business-built tool to an industrial product, and a method for the next app.
